

Deliverable 3 — Use-Case Flow Specification

UC-02 Apply to Drive • Campus Placement & Internship Pipeline

Name	SRN	Course
Aaditya Shankar Chandan	PES1UG24CS003	Software Engineering - Lab 1

Primary Actor	Student Applicant
Secondary Actor	Academic Records System (supporting)
Scope & Level	Campus Placement & Internship Pipeline (portal) - user-goal level
Trigger	Student Applicant opens an open drive from the Drives list and selects Apply.
Traces to	FR-001, FR-002, FR-003, NFR-002
Relationships	«include» UC-06 Verify Eligibility; extended by «extend» UC-07 Request Eligibility Waiver

Preconditions

1. The Student Applicant is authenticated and has a parsed resume on their profile (UC-01 completed).
2. The drive is published and its application window is currently open.
3. The Academic Records System is reachable and holds the student's CGPA and active-backlog figures for the current semester.
4. The student's accepted-offer count is below the drive's prior-offer cap.

Postconditions

1. An application record linking the student to the drive is persisted with status Submitted and a UTC timestamp.
2. The student appears exactly once in the drive's applicant list shown to the Company Recruiter.
3. An append-only audit entry records the per-tier eligibility verdict and the actor who submitted the application (NFR-002).
4. A confirmation showing the drive, its round schedule and the window close time is sent to the student.
5. Failure guarantee: on any error no application record is created, the drive's applicant count is unchanged, and the attempt is still logged with its refusal reason.

Main Success Scenario

1. Student Applicant opens the Drives list and selects an open drive.
2. System displays the drive's role, CTC band, round structure, eligibility rule set and the time remaining in the application window.
3. Student Applicant selects "Apply".
4. System performs «include» UC-06 Verify Eligibility: it fetches the current CGPA and active-backlog count from the Academic Records System and evaluates every tier of the rule set - minimum CGPA, maximum backlogs, permitted branches and prior-offer cap.
5. System confirms that every tier passes and shows the eligibility summary alongside the skill tags matched from the parsed resume (FR-001).
6. Student Applicant confirms which resume version to attach and submits the application.
7. System re-checks that the application window is still open at the instant of submission.
8. System persists the application with status Submitted, adds the student to the drive's applicant list, and writes the audit entry.
9. System displays a confirmation with the round schedule and updates the Placement Officer's dashboard with the new applicant count.
10. Use case ends successfully.

Alternate Flows

5a. One or more eligibility tiers fail (extension point: eligibility rejected -> «extend» UC-07 Request Eligibility Waiver)

- 5a1. UC-06 returns at least one failed tier, for example ACTIVE_BACKLOG or CGPA_BELOW_MINIMUM.
- 5a2. System marks the drive Ineligible and lists each failed tier with the value held on record beside the value required; the drive is not hidden.
- 5a3. If the student believes the academic record is stale they select "Request waiver / re-check", which starts UC-07 and routes the discrepancy to the Placement Officer.
- 5a4. If the officer approves the waiver the flow resumes at step 6; otherwise the use case ends with no application created.

7a. Application window closes during the session

- 7a1. The window close time passes between step 3 and step 7.
- 7a2. System refuses the submission with reason WINDOW_CLOSED and shows the exact close timestamp.
- 7a3. System offers the list of drives that are still open to the student.
- 7a4. Use case ends with no application record created.

Exception Flow

- 4a. Academic Records System unreachable - the system does not fall back to a cached CGPA. The application is held as Pending Verification for up to 2 hours and retried; if verification still fails the student is notified to retry before the window closes, and the failed attempt is logged.
